As a consequence, handheld US of the breast should only be carried out by specially trained and experienced physicians, preferentially a breast radiologist. However, more research is needed to see if it has a role in combination with mammography or breast MRI [79].

It can be considered as an adjunct to mammography in asymptomatic women. Can women consider breast US being free from any potential negative consequences? If the suspicion of cancer persists after targeted US or the lesion cannot be clearly identified at US, further work-up is necessary such as a needle biopsy under mammographic guidance or, in particular cases, contrast-enhanced MRI or contrast-enhanced mammography. Breast cancer.

Personalized Ultrasound Solutions Because every patient's scare should be... patients with 71 malignant breast tumours were included in the study from December until December No current signs or symptoms of breast cancer e.
