Although many traditional sample-preparation methods for flavonoids are still in use, there have been trends in recent years towards: 1 use of smaller initial sample sizes, small volumes or no organic solvents; 2 greater specificity or greater selectivity in extraction; 3 higher recoveries or better reproducibility; and, 4 increased potential for automation. Results proved that Advances in Chromatography: Volume 45 and flavanones form trimethylsilyl oximes while flavonol and flavones provide simple trimethylsilyl derivatives. Usually the spectra, collected in the range nm, are compared with the spectra of reference compounds by evaluating the degree of overlapping.
